

➤ Summary Report:

“Analysing E-Learning Platform Purchases Using SQL”

✓ Overview:

In this project, I analysed an e-learning platform dataset using MySQL. The dataset included three tables: learners, courses, and purchases. The main aim was to understand learner purchase behaviour, identify the most popular courses, and find which course categories generated more revenue.

✓ Key Insights:

From the analysis, it is clear that the platform has learners from different countries, which shows that the platform has a wide reach. By joining the three tables, I was able to view learner details, course information, and purchase records together.

One important finding was that some courses were purchased more often than others. These courses can be considered the most popular courses on the platform. This shows that learners are more interested in certain subjects, probably because they are more useful or in demand.

The category-wise analysis also showed that some course categories earned more revenue than others. This means that not all categories perform in the same way. A few categories contribute more to the platform's income.

Another useful finding was that some learners purchased courses from more than one category. This suggests that learners are interested in exploring different subjects and not limiting themselves to just one area.

✓ Recommendations:

The platform should give more focus to the courses that are already performing well. These courses can be promoted more, since they already have good demand among learners.

Since some learners are buying courses from different categories, the platform can also recommend related courses after a purchase. This may help increase learner engagement and sales.

✓ Conclusion:

Overall, this analysis helped in understanding learner behaviour, course demand, and revenue patterns on the e-learning platform. The results show that the platform can improve its performance by promoting popular courses, improving low-performing courses, and encouraging learners to explore more categories.
